

FbF® Inmate ID

for Offender Management

Never release the wrong inmate again with FbF® Inmate ID's foolproof ability to match an inmate's biometric data to exactly the right inmate...in less than a second.

FbF Inmate ID is an iris-based offender identification and management solution for detention centers. Enrollment and release are now done rapidly and error-free. Quickly create demographic and biometric profiles for inmates, assign locations, and add any relevant information. Recidivist inmates are accurately identified upon return without re-enrolling them.

FbF Inmate ID is used for:

- Enrollment and release of an inmate
- Tracking currently assigned location of an inmate
- Fast biometric check-in and check-out
- Instant headcount (who's in the facility?)

The FbF Inmate ID system allows an officer to capture an inmate's iris images, a mug shot, and any other biographic information for storage in the FbF® bioServer inmate database. The FbF bioServer search engine quickly does the biometric matching.

Iris scanners use near-infrared (NIR) imaging technology to capture high-resolution pictures of the iris. The unique patterns of the iris are used for verification or identification of the individual. High-resolution iris images contain far more reference points than fingerprints and are substantially more accurate.

Benefits

- As quick and easy as taking a picture
- Streamlines re-enrollment
- Quick, easy subject re-enrollment with an audit trail
- Query records with text-based biographic searches and create reports
- Faster than fingerprint scans
- Not impeded by glasses or normal contact lenses
- Average search-and-match takes 1 second
- Reduces paper-based subject ID
